ABSTRACT

With environment protection becoming a serious global concern, the philosophies of green chemistry have begun to have a lot of influence on the way in which chemical reactions are designed and conducted. Design and development of environment friendly methods of processing and production has become an important concern and atom economic methods of syntheses are also greatly stressed upon. These important initiatives will have more relevance if common persons are made aware that many chemicals used in day-to-day life are often very toxic and therefore need to be used judiciously.

Keywords: Toxicity of Chemicals.
