### ABSTRACT

New series of 10-(2-Styryl-5,6-dihydro-imidazo[2,1-b][1,3,4]thiadiazole-6-yl)-10H-phenothiazine were synthesized by cyclization of various carboxylic acid with thiosemicarbazide in presence of sulphuric acid was to get compound **1**. Another way phenothiazine treated with chloroacetyl chloride yielded compound **2**. Further, cyclization of compounds **1** and **2** followed by refluxation about 18 h to get the final products **3** and **3a-3i** of the series. The structures of compounds were confirmed by IR, <sup>1</sup>H-NMR, <sup>13</sup>C NMR and mass spectroscopy and by chemical analysis. All the above compounds were screened for their antimicrobial activity against some selected bacteria and fungi such as *E. coli*, *B. subtilis*, and *S. typhi* bacteria and *A.niger*, *A. flavus* and *F. oxisporium* fungi.

### Graphical Abstract

**Keywords:** Thiadiazole, Phenothiazine, Imidazole, Antimicrobial activities.

### INTRODUCTION

In the past years, the literature is enriched with progressive finding about the synthesis and pharmacological actions of fused heterocycles [1]. In the field of synthetic organic chemistry nitrogen-sulphur heteroatom containing aromatic molecules particularly 10-*H*-phenothiazine and 1,3,4-thiadiazole are becoming more popular as an area of research and provides a most valuable molecular template for the development of new molecule that are able to interact with a wide variety

of biochemical processes. They have been shown to possess a broad spectrum of pharmacological activities such as anti-tubercular [2-3] anti-tumour [4] anti-inflammatory [5] antihyperlipidemic [6], cytotoxic [7], antimicrobial [8] and antiproliferative [9] agents. In continuation in the our aim synthesis of new bioactive molecule by incorporating phenothiazine and 1,3,4 heterothiadiazole moieties in a single molecular framework, both molecule have broad biological spectrum such as antibacterial [10-11], antifungal [12-13] anticancer [14-15], anticonvulsant [16-17], antitubercular [18-19] and anti-inflammatory [20-21] herein, we carry out the synthesis and antimicrobial evaluation of some new synthesized molecule. Number of molecules have been claimed by researchers Imidazo [2,1-b]-1,3,4-thiadiazole all around the world because of its excellent biological profile. We have decided to synthesize a new series of 10-(2-Phenyl-imidazo [2,1-b][1,3,4]thiadiazol-6-yl)-10H-phenothiazine shown in Scheme 1. The starting material, thiosemicarbazide undergoes cyclodehydration of acyl thiosemicarbazides treated with in situ by heating the various carboxylic acid in presence of  $H_2SO_4$  yielded compound **1**, 5-Phenyl-[1,3,4]thiadiazol-2-ylamine. In another separate reaction 10-H phenothiazine treated with chloroacetyl chloride yielded compound **2**, 2-Chloro-1-phenothiazin-10-yl-ethanone. Further condensation reaction of compound **2** and compound **1** under reflux in dry ethanol 18 h yielded compound **3**, 10-(2-Phenyl-imidazo[2,1-b][1,3,4]thiadiazol-6-yl)-10H-phenothiazine, further compounds (**3a-3i**) synthesized by similar method as reported earlier. The structure of compounds **1** and (**1a-1i**), compound **2**, and compound **3** and (**3a-3i**) were confirmed by IR,  $^1H$  NMR,  $^{13}C$  NMR, mass and chemical analysis. All the compounds **3** and (**3a-3i**) were screened for their *in vitro* antimicrobial activity against some selected bacteria and fungi.

## MATERIALS AND METHODS

All the chemicals and reagents were of analytical grade of sigma Aldrich, Merck, Chemi-loba and Himedia. The reagents and solvents were purified before using by standard methods. Melting points were taken in open capillaries and are uncorrected. Progress of reaction was monitored at various stages by silica gel-G coated TLC plates using MeOH:  $CHCl_3$  system. The spot was visualized by exposing dry plate at iodine vapour chamber and fluorescent indicator F 254 UV chamber. IR spectra were recorded in KBr disc on a Shimadzu 8201 PC, FTIR spectrophotometer ( $\nu$  max in  $cm^{-1}$ ) and  $^1H$  NMR and  $^{13}C$  NMR spectra were measured on a Bruker DRX-300 spectrometer in  $CDCl_3$  at 500 and 75 MHz respectively using TMS as an internal standard. All chemical shifts were reported on  $\delta$  scale. The mass spectra were recorded on a Jeol SX-102 GC-MS mass spectrometer. Elemental analyses were performed on a Carlo Erba-1108 analyzer. The analytical data of all the compounds were highly satisfactory. All the synthesized compounds were purified by column chromatography using Merck silica Gel 60 (230-400 Mesh). The reagent grade chemicals were purchased from the commercial sources.

**Synthesis of 5-Phenyl-[1,3,4]thiadiazol-2-ylamine (1):** Equimolar mixture of thiosemicarbazide (0.004 mole) and benzoic acid (0.004mole) in presence of  $H_2SO_4$  in dry ethanol (25 ml) was refluxed on a water bath for about 2 h TLC was used to check reaction progress, then mixture was removed and poured in crushed ice to get a white precipitate, compound **1**. A solid product was obtained which was purified over a silica gel column using chloroform: methanol (8:2 v/v) mixture as eluant. The elute was concentrated to get a solid product which was recrystallized from ethanol to yielded compound **1**: White crystalline solid. M.P. 223-225  $^{\circ}C$ , Yield 70 %, IR ( $\nu$  max  $cm^{-1}$ ): 1430 ( $\nu_{C-C}$ ), 1070 ( $\nu_{C-N}$ ) 763 ( $\nu_{C-S}$ ), 1454 ( $\nu_{C=C}$ ), 1585 ( $\nu_{N=C}$ ), 3378 ( $\nu_{NH_2}$ ),  $^1H$  NMR:  $\delta$ (ppm) 4.87 (2H, s,  $NH_2$ ), 7.29-7.73 (5H, m, Ar-H),  $^{13}C$  NMR :  $\delta$  (ppm)126.9-131.01(C of aromatic ring), 169.4,163.8( $C_2,C_5$  of thiadiazole ring), Anal. Calcd. for  $C_8H_7N_3S$ : C, 54.22, H, 3.98, N, 23.71 % found C, 54.09, H, 3.70, N, 23.40 % ; MS 177.03 ( $M^+$ ).

The compounds **1a-1i** was synthesized by the similar method as reported earlier.

**5-(2-chloro-phenyl)-[1,3,4]thiadiazole-2-ylamine (1a):** M.P.229-230 $^{\circ}C$ , Yield 72%, IR ( $\nu$  max  $cm^{-1}$ ): 1433( $\nu_{C-C}$ ), 1072 ( $\nu_{C-N}$ ), 780 ( $\nu_{C-S}$ ),1541( $\nu_{C=C}$ ), 1587 ( $\nu_{N=C}$ ), 745 ( $\nu_{C-Cl}$ ) 3380 ( $\nu_{NH_2}$ ),  $^1H$  NMR  $\delta$ (ppm) 4.73(2H, s,  $NH_2$ )7.27-8.18 (4H, m, Ar-H),  $^{13}C$  NMR:  $\delta$ (ppm) 127.5-133.1(C of aromatic

ring), 163.3, 169.4 (C<sub>2</sub>C<sub>5</sub> of thiadiazole ring), Anal. Calcd. for C<sub>8</sub>H<sub>6</sub>ClN<sub>3</sub>S: C, 45.39, H, 2.86, N, 19.85% found C, 45.09, H, 2.70, N, 19.40%; MS 211.01 (M<sup>+</sup>).

**5-(3-chloro-phenyl)-[1,3,4]thiadiazole-2-ylamine (1b):** M.P. 228-230°C, Yield 69%, IR (ν max cm<sup>-1</sup>): 1429 (ν<sub>C-C</sub>), 1069 (ν<sub>C-N</sub>), 779 (ν<sub>C-S</sub>), 1537 (ν<sub>C=C</sub>), 1587 (ν<sub>N=C</sub>), 737 (ν<sub>C-Cl</sub>), 3382 (ν<sub>NH2</sub>), <sup>1</sup>H NMR: δ (ppm) 4.75 (2H, s, NH<sub>2</sub>), 7.35-7.68 (4H, m, Ar-H), <sup>13</sup>C NMR: δ (ppm) 126.91-31.01 (C of aromatic ring), 169.2, 162.9 (C<sub>2</sub>C<sub>5</sub> of thiadiazole ring), Anal. ## RESULTS AND DISCUSSION

The reaction of thiosemicarbazide and benzoic acid afforded compound **1**. The IR spectrum ( $\nu \text{ cm}^{-1}$ ) of compound **1** showed absorption peaks at 1560-1650 for ( $\nu_{\text{N=C}}$ ), 760-790 for ( $\nu_{\text{C-S}}$ , thiadiazole ring) and peaks at 3350-3430 for ( $\nu_{\text{NH}_2}$ ). The  $^1\text{H NMR}$  spectrum  $\delta$  (ppm) exhibited the value at 3.9-4.9 (2H, s,  $\text{NH}_2$ ), 7.28-7.95 (5H, m, Ar-H) and  $^{13}\text{C NMR}$  spectrum gave  $\delta$  (ppm) at 163-170 ( $\text{C}_2, \text{C}_5$  of thiadiazole ring) supporting the structure of the compound **1**. Similarly the compounds **1** and **1a-1i** have been synthesized by taking the various derivatives of benzoic acid. The IR spectra gave absorptions in the range of 1665-1675  $\text{cm}^{-1}$  while strong signals appeared in the range of  $\delta$  (ppm) 3.9-4.9 and 7.39-8.20 in the  $^1\text{H NMR}$  and  $\delta$  (ppm) 163-170 in the  $^{13}\text{C NMR}$  spectra supported the formation of compounds **1a-1i** respectively. Another reaction was carried out between phenothiazine and chloroacetyl chloride to give compound **2**. The IR spectrum showed absorptions at 1671  $\text{cm}^{-1}$  due to the presence of carbonyl function, 685 ( $\nu_{\text{C-S-C}}$  phenothiazine), 735 ( $\nu_{\text{C-Cl}}$ ), 2836 ( $\nu_{\text{CH}_2}$ ). In the  $^1\text{H NMR}$ , strong signals found at 4.35 (2H, s acyclic  $\text{CH}_2$ ), 7.14-7.40 (8H, m, Ar-H) and  $^{13}\text{C NMR}$  spectra gave signals at  $\delta$  (ppm) 123.1-138.8 (C of phenothiazine ring), 165.5 (C=O acyclic), 42.2 ( $\text{CH}_2$  acyclic) supporting the confirmation of synthesis of compound **2**. The compounds **1** and **1a-1i** on reaction with equimolar amount of compound **2** in ethanol gives the compounds **3** and **3a-3i**. These compounds showed a characteristic IR absorptions in the range of 1580-1600  $\text{cm}^{-1}$  in the IR spectra showing the presence of N=C in the imidazole ring. The  $^1\text{H NMR}$  spectra clearly indicated the presence of one proton in imidazole ring in the range of  $\delta$  (ppm) 6.68-6.79. The  $^{13}\text{C NMR}$  spectra of compound **3** and **3(a-i)** also supported the formation of imidazole ring,  $\delta$  (ppm) 100.1-100.9 and 149.9-150.9 the above structures were supported by fact that the disappearance of  $\text{NH}_2$  proton and the appearance of N=CH proton in the range of  $\delta$  (ppm) 6.68-6.79 (cyclic CH) in the  $^1\text{H NMR}$  spectra of compound **3** and **3a-3i**. The compounds **2** and **2a-2i** and **3** and **3a-3i** were synthesized and compounds **3** and **3a-3i** screened for their antibacterial and antifungal activity against some selected bacteria and fungi respectively. Nitro group containing compounds showed higher activity in the order (**3i** > **3g** > **3h**) than chloro (**3c** > **3a** > **3b**) or bromo group containing compounds in the order (**3f** > **3d** > **3e**). On the basis of structural activity relationship (SAR), concluded that the activity of compounds depends on electron withdrawing nature of the substituted groups,  $\text{NO}_2 > \text{Cl} > \text{Br} > \text{H}$ . The MIC value of the synthesized compounds and standard drug showed in the Table 2.

**Biological Activity:** All the newly synthesized compounds were active against selected microorganisms. The minimal inhibition diameters were determined by using the filter paper disc diffusion method [22-23] and the concentrations have been used in ppm, the compounds **3** and (**3a-3i**) have been screened in vitro for their antibacterial activity against *B. subtilis*, *K. pneumoniae* and *S. aureus* and antifungal activity against *A. niger*, *A. flavus* and *C. albicans*. Standards for antibacterial and antifungal activity streptomycin and griseofulvin were used respectively for comparison.

Physicochemical data of the synthesized compounds shown in table 1 and MIC value of the compounds compare in table 2.

**Anti microbial activities:** The synthesized compounds 3 and 3a–3i were evaluated *in vitro* for antibacterial activity by using filter paper disc diffusion method against different strains of bacteria viz. *B. subtilis*, *E. coli* and *S. typhi*. The entire final product along with standard antibacterial Streptomycin was used at 50 and 100 ppm concentrations. Antifungal activity against *A. niger*, *A. flavus* and *F. oxisporium* at 50 and 100 mg mL<sup>-1</sup> concentrations by filter paper disc technique. The minimum inhibitory concentration (MIC) values of the synthesized compounds were determined.

Standard antibacterial streptomycin and antifungal griseofulvin were also tested under the similar conditions for comparison (Table 3 and 4).

## APPLICATION

The hybrid molecules we report are highly active. This novel series of compounds pave a way into a new class of antimicrobial compounds. Their structures are flexible there are various reacting sites, which can be modified through structural optimizations to further enhance their activity and produce compounds which could result in main leads for new antimicrobial drugs. As we succeeded in our attempt of synthesizing hybrid substituted amino thiadiazole and chloro carbonyl derivative of phenothiazine and got highly encouraging results, there for medicinal chemists should focus on further development of such hybrids. In present work we focused on antimicrobial potential of these molecules. In conclusion our work has opened a new class of antimicrobial leads for medicinal chemists to work with.

## CONCLUSIONS

In the conclusion we were successful in the initial hypothesis of synthesizing broad spectrum antibiotics through experimentation. We report a successful effort to combine pharmacophoric groups; 5-Phenyl-[1,3,4]thiadiazol-2-ylamine and Chloro-1-phenothiazin-10-yl-ethanone and the compounds were synthesised in good yield. The structures of compounds were established by FT-IR, <sup>1</sup>H NMR, <sup>13</sup>C NMR and Mass spectrometry techniques. The synthesized compounds possess broad spectrum activity against bacterial and fungal strains.

## ACKNOWLEDGEMENTS

The authors are thankful to SAIF, Punjab University, Chandigarh (India) And IISER Bhopal, (M.P.) India for providing spectral and analytical data of the synthesized compounds. We are also grateful to Mr. Vahid-Ul-Hassan, department of Zoology Dr. H.S. Gour University, Sagar [M.P.] for providing help in carrying out the antimicrobial screening. We are also thankful to Head, Department of Chemistry, Dr. H. S. Gour Central University Sagar (India) for giving the facilities to carry out the work And UGC-New Delhi (India), for financial assistance as R.G.N.F. fellowship.
